

# FOCUS Energetic Ionic Detox Footbath System

## What do the colors in the water mean?

With different water conditions your FOCUS energetic system will not necessarily cause color changes in the water; but, the very process of energizing the water does. The interaction of the unit with the City added chemicals can cause quite a discoloration in the water. It must neutralize those chemicals and energizes the water. Some sediment is seen depending upon the amounts of solids that are inherent in water to begin with. The final result has to do with the health of the person being treated. This will then determine the water color change. If the person is in reasonably good health, the body will absorb energy from the water. Otherwise the body will only absorb what energy it can handle. It has been stated by various other companies that the water colors relate to the following:

**Yellow - Green = detoxifying from the kidney, bladder, urinary tract, female/prostate area.**

**Orange = detoxifying from the joints**

**Brown = detoxifying from the liver, tobacco, cellular debris**

**Black = detoxifying from the liver, gallbladder**

**Dark green = detoxifying from the gallbladder**

**White foam = mucous from lymph**

**White cheese-like particles = Most likely yeast**

**Black flecks = heavy metals**

**Red flecks = blood clot material.**

More important than the color change is an oily substance on the surface thereby indicating energy being produced (called EMASS by researchers) and the change in color of the urine caused by the release of toxins & stimulation & elimination of the lymphatic system.

## What's in the water?

At first, we use distilled water and add 1/4 teaspoon of Himalayan salt crystals. After the footbath, you will witness a combination of high grade plant food (waste) and fatty deposits that have been released by the cells into the lymphatic system then drawn through the tissue into the bath.

## How long are the treatments?

One footbath session lasts a maximum of 35 minutes. A Cycle consists of 14 footbaths, suggested 3 times per week; wait 21 days and begin again. These cycles can continue for years to assist your body in releasing toxins.

## REGULAR USE OF THE FOCUS BATH CAN ACHIEVE:

- 💧 Cellular Cleansing
- 💧 Anti-aging
- 💧 Boosted Immune System
- 💧 Clearer Skin Complexion
- 💧 Activates body's natural elimination system,  
including lymph node
- 💧 Joint/ Pain Relief
- 💧 Weight Loss
- 💧 Increased Circulation
- 💧 Reduced Stress & Fatigue
- 💧 Reduced Swelling/Inflammation
- 💧 Improved Joint Stiffness
- 💧 And more...

## How Does It Work?

FOCUS Energetic Detox Footbath System is creating an energy field within the body & an osmosis environment to move cellular waste out of the body.

## ENERGY FIELD

FOCUS Energetic Ionic Detox Footbath System creates an energy field stimulating cellular energy and increasing cellular cleansing at an increased rate, restoring the body to its balanced energy levels. The cells of a healthy human have a charge between 70-90 millivolts. Within this range cells perform properly & efficiently. Stressed or injured cells can measure as little as 10-20 millivolts, resulting in both poor nutritional absorption and toxic waste discharge due to build up of positive ions from poor diets, stress and toxic environment.

The FOCUS Energetic Ionic Detox Footbath System generates ions 35 times higher than your average footbath. For example at 1.6 amps, the FOCUS machine would be around 14 to 15 volts. The FOCUS Standard model runs as high as 3.00 amps and the FOCUS Professional model runs as high as 5.50 amps there by the ion voltage would be even higher. The ions being generated run through the body negating the free radicals in the body by attracting negative & positive ions. These highly charged ions energize & stimulate the cells to release cellular waste & strengthen the cells over time. The energy field being generated increases the body's cellular energy there by the cells begins to function at its normal energy levels.

# OSMOSIS

The 'energetic footbath' is a process application of another medically approved process, Peritoneal Dialysis. This process uses osmosis to remove impurities from the body.

Osmosis is the phenomenon of fluids passing through a semi-permeable membrane, from a less dense solution into a higher dense solution. When working with the human body, this fluid transfer takes valence toxins from the body into the solution (the size of the molecule has to be small enough to pass through the pores of the membrane). This process will not disturb protein and other molecules that are too large to pass through the pores of the membrane. Within each thirty-five minute "energetic footbath" treatment, the body releases what it is ready to let go of at that moment in time. Each footbath will affect the body differently, as it continues to move more toward maintaining a healthy balance. Since every person has a unique body, you can expect each person will be affected differently with each treatment. The body's energetic field is stimulated, this tells the cells to release their toxins into the lymphatic system. The waste that is not drawn out, during the 35 minute process, will continue to be dumped into the lymphatic system and will be released during the body's natural elimination process. One can expect stronger urine & more stool from 3 to 5 days after having one 'energetic footbath'.

The addition of a small amount of Himalayan Salt into the footbath provides the electrolyte for the Exciter, as well as the immediate generation of ions. We have chosen to use the Himalayan Crystal Salt because of its balanced crystalline structure, which can be easily metabolized by the body.

Once the Himalayan Salts are introduced into the bath water, the Na (sodium) and Cl (chloride) separate to form negative and positive ions. The Exciter is configured to maximize the negative ions in the solution. Negative ions will bind with some of the molecules it encounters, effectively giving them a negative charge. The negatively charged material will be attracted to and bound by a positive (or less negatively charged) element. The Exciter also creates two streams of bubbles (hydrogen and oxygen) while actively working within the water. This makes the water heavier, or dense, and accelerates the osmotic effects of the process.

Two electrodes - the cathode and the anode. The cathode provides a surface where contact can be made between electrons from the power source and the reactant in solution that is to be reduced. The cathode has a negative charge and attracts the cations in the electrolyte. The anode provides a surface where the reactant being oxidized can deposit the electrons it loses. The anode has a positive charge and attracts the anions in the electrolyte.

An electrolyte. This is the substance in a dissolved or liquid phase that permits ions to move between the electrodes, which balances the flow of electrons in the external circuit.
